

# [SOUND DEVICE OF VIDEO GAME SYSTEM]

## Abstract

A sound device of a video game system is provided. The video game system has at least a video game player having a first control circuit and a first communication interface and second communication interface. The sound device has a game controller, a third communication interface and a second control circuit. The game controller is connected to the first communication interface, the third communication interface is connected to the second communication interface and the second control circuit is connected to the third communication interface, a speaker, a microphone, a volume regulator and a microphone switch. A signal generated by operating the volume regulator and the microphone switch can be used by the second control circuit to control a volume of the speaker and to turn on/off the microphone, and players can communicate with each other via the speaker and the microphone without wearing an earphone and microphone while playing online video game.
